

A NEW WAY TO DEBUG LOGS

**Your senior
engineer
knows which logs
to check.**
**The new hire
doesn't.**

Here's how we fixed that for QA, Support & Engineering. 🙌

THE HIDDEN PROBLEM

Every production incident needs the **same four things**:

The right correlation ID — which one of the dozen?

The right Loki / Datadog / CloudWatch query

Knowledge of which module logs what

Awareness of recurring error patterns

 All of these in **senior engineers' heads**.

MEET LOGLENS

LogLens

A VS Code extension that turns **Claude Code** into
a
domain-aware log investigator for your service.

SCHEMA-DRIVEN

NO API KEY

FREE + OPEN SOURCE

TEAM-FIRST

HOW IT WORKS

A small JSON folder in your repo describes your service.

1

Schema author runs once

Asks Claude to scan the codebase. AI generates `.loganalysis/` files.

2

Commit to git

Schemas become part of the repo. Every teammate inherits them on next pull.

3

Anyone debugs from chat

QA, Support, Devs — all use Claude Code chat. No tribal knowledge needed.

**LogLens**

THE MAGIC MOMENT

Real chat. Real workflow.

> Use LogLens to investigate: users can't sign in

⚡ LogLens [start_investigation]

Matched: **Auth Errors**. Please share the `sessionId`.

> `sessionId` is `sess-abc-123`

⚡ LogLens · Investigation Context

📋 Loki: `{app="auth"} |= "sess-abc-123"`

🔍 Pattern: `[AUTH-002] Session expired`

📖 Playbook: PLAY-AUTH-001 – Trace the JWT refresh

WHO BENEFITS

Built for **every role** that touches production.

QA

Investigate failures without pinging engineering

Support

Triage customer issues in seconds, not hours

Developers

Faster RCA, less context-switching

New hires

Day-1 productivity. No bottleneck.

THE UNFAIR ADVANTAGE

per investigation.

LogLens uses Claude Code's own LLM via MCP.
No Anthropic key. No OpenAI key. No per-token cost.

✓ Zero outbound calls

✓ Schemas in your repo

✓ No telemetry

✓ MIT open source

THE COMPOUNDING EFFECT

Every incident makes LogLens **smarter**.

The schema is your team's **living, version-controlled debugging wisdom**.

A real team workflow

Day 1 → Generate starter schema. 5 issue categories.

Month 2 → Add patterns post-incident. 8 categories.

Month 6 → Refresh after big release. 12 categories.

Year 1 → New hires onboard in days, not weeks.

BEFORE VS AFTER

The difference is **hours saved.**

WITHOUT

- Paste 10K logs at ChatGPT
- Get generic advice
- Guess which ID to use
- Manually craft Loki query
- Ping a senior on Slack
- Wait. Iterate. Repeat.

WITH LOGLENS

- Describe issue in chat
- Claude asks for right ID
- Pre-filled Loki query
- Known patterns matched
- Playbook surfaces cause
- Done. Move on.

Try LogLens today.

Install from the VS Code Marketplace.
Click "Setup" when prompted. Reload.
Ask Claude Code. **30 seconds.**
